

AMENDMENT UNDER 37 C.F.R. § 1.111  
U.S. Application No. 09/750,688  
Attorney Docket No. Q62534

**AMENDMENTS TO THE CLAIMS**

**This listing of claims will replace all prior versions and listings of claims in the application:**

**LISTING OF CLAIMS:**

1. (original): Input buffer type packet switching equipment, comprising:

M input line buffers that store cells inputted from M input lines temporarily in a state that one of said M input line buffers stores cells inputted from corresponding one of said M input lines, in this the M is an integer being 2 or more;

an  $M \times N$  crossbar type switch, which provides N output lines for switching cells outputted from said M input line buffers based on a cross point on/off control signal, in this N is an integer being 2 or more;

N output line sections, which are provided for each of said N output lines of said  $M \times N$  crossbar type switch, for outputting cells applied switching at said  $M \times N$  crossbar type switch to N external output lines; and

an arbiter that outputs a connection permission signal to one of said M input line buffers based on connection request signals outputted from said M input line buffers, and also outputs said cross point on/off control signal to said  $M \times N$  crossbar type switch, and outputs said connection permission signal at a designated slower timing interval than a normal timing interval to one input line buffer that outputs cells to an external output line whose output line rate is slower than a corresponding input line rate.

AMENDMENT UNDER 37 C.F.R. § 1.111  
U.S. Application No. 09/750,688  
Attorney Docket No. Q62534

2 (original): Input buffer type packet switching equipment accordance with claim 1,  
wherein:

    said arbiter, comprising:

        a connection request signal processing section that receives said connection request  
        signals from said M input line buffers and processes said received connection request signals;

        a contention controller for deciding that one of said M input line buffers requested the  
        connection reads cells for what external output line based on the connection request from said M  
        input line buffers outputted from said connection request signal processing section; and

        a connection permission signal processing section that outputs said connection  
        permission signal to one of said M input line buffers based on the contention processed result  
        from said contention controller and also outputs said cross point on/off control signal to said M ×  
        N crossbar type switch, and wherein:

            in case that said connection permission is given to one input line buffer which outputs  
            cells to the external output line whose output line rate is slower than the corresponding input line  
            rate, said connection permission signal processing section controls so that said contention  
            controller does not execute the contention control for a designated interval corresponding to the  
            slower output line rate than the input line rate.

3. (original): Input buffer type packet switching equipment in accordance with claim 2,  
wherein:

AMENDMENT UNDER 37 C.F.R. § 1.111  
U.S. Application No. 09/750,688  
Attorney Docket No. Q62534

in case that said connection permission is given to one input line buffer which output cells to the external output line whose output line rate is slower than the corresponding input line rate said connection permission signal processing section outputs a mask signal for stopping the contention control for a designated period to said contention controller and also outputs a mask cancellation signal for canceling the stopping of said contention control after passing said designated period to said contention controller.

4. (original): Input buffer type packet switching equipment in accordance with claim 3, wherein:

said designated period is designated times of a normal timing interval of said connection permission signal in the case that said connection permission is given to one input line buffer for an external output line whose output line rate is the same that the corresponding input line has.

5 (original): Input buffer type packet switching equipment in accordance with claim 1, wherein:

each of said M input line buffers comprising:  
N FIFOs, whose number is the same that said output lines of said  $M \times N$  crossbar type switch have, for storing cells for said N external output lines temporarily and outputting said connection request signal at the time when said cells are stored;

AMENDMENT UNDER 37 C.F.R. § 1.111  
U.S. Application No. 09/750,688  
Attorney Docket No. Q62534

a distributor that distributes cells inputted from said M input lines to each of said FIFOs, corresponding to said external output line obtained from header information of said cells; and a selector that selects one FIFO to be read corresponding to said connection permission signal inputted from said arbiter from said N FIFOs.

6. (original): An output line rate converting method at input buffer type packet switching equipment, which provides:

M input line buffers that store cells inputted from M input lines temporarily in a state that one of said M input line buffers stores cells inputted from corresponding one of said M input lines , in this the M is an integer being 2 or more;

an  $M \times N$  crossbar type switch, which provides N output lines for switching cells outputted from said M input line buffers based on a cross point on/off control signal, in this N is an integer being 2 or more;

N output line sections, which are provided for each of said N output lines of said  $M \times N$  crossbar type switch, for outputting cells applied switching at said  $M \times N$  crossbar type switch to N external output lines; and

an arbiter that outputs a connection permission signal to one of said M input line buffers based on connection request signals outputted from said M input line buffers, and also outputs said cross point on/off control signal to said  $M \times N$  crossbar type switch, wherein:

said arbiter, comprising the step of:

AMENDMENT UNDER 37 C.F.R. § 1.111  
U.S. Application No. 09/750,688  
Attorney Docket No. Q62534

outputting said connection permission signal to one of said M input line buffers by using a designated slower timing interval than a normal timing interval in case that cells are outputted to an external output line whose output line rate is slower than a corresponding input line rate.

7. (new): A method of outputting data in packet switching, comprising:

storing data inputted from a plurality of input lines; and

selectively outputting said stored data to a plurality of external line sections;

wherein said stored data output to an external line section with an output line rate slower than a corresponding input line rate is outputted at a designated rate slower than said corresponding input line rate.

8. (new): The method of claim 7, wherein said designated rate corresponds to said output line rate.

9. (new): The method of claim 7, wherein said stored data is outputted to said plurality of external line sections at rates corresponding to respective input line rates when output line rates of said plurality of external line sections are at least the corresponding input line rates.

AMENDMENT UNDER 37 C.F.R. § 1.111

U.S. Application No. 09/750,688

Attorney Docket No. Q62534

10. (new): The method of claim 7, wherein said external line section is a bufferless component.
